Brake and Clutch Pedal Rubber

Function

The pedal rubber is made of an ethylene propylene diene monomer rubber (EPDM), which provides an anti-slip surface offering reliable grip in wet conditions. This allows the driver to operate the brake and clutch peddles safely.

Cause of failure

The constant use of the brake and clutch pedal will eventually wear-out the pedal rubber. If the grooves are worn smooth, the driver's foot could slip off of the pedal - potentially causing loss of control of the vehicle.

A worn pedal rubber is a safety-critical part which may result in the vehicle failing its regular safety inspection. Therefore, this part requires regular checking and should be replaced as necessary.
